

ABSTRACT

An occupant protection system capable of sufficiently pushing up the left and right sides of a seat cushion from below without having to use a high-output gas generator. An enclosure encloses an inflatable airbag arranged on a seat pan for pushing the front of a seat cushion from below. The airbag extends along the width of the seat pan. The bag enclosure is arranged in the longitudinal center of the airbag. The perimeter of the bag enclosure is smaller than that of the airbag in an inflated condition. The bag enclosure is fixed to the seat pan.
